

ICT12-054 - The Information Bottleneck Principle in Multiterminal Communication and Inference

Zusammenfassung

Wireless networks are pervading our everyday lives. We use mobile smart phones in cellular systems, connect notebook and tablet computers to WiFi hotspots, couple our consumer electronic devices via Bluetooth, and take it for granted that our TV and radio programs are distributed via terrestrial and satellite wireless networks. Less apparently, networks of sensors monitor our environment, buildings, and industrial facilities. In the near future, the "Internet of Things" will connect our domestic appliances, vehicles, and all kinds of gadgets. In order to deal with the data deluge caused by all these networks, the project TINCOIN aims at establishing a radically new approach to wireless network design based on the recent information bottleneck principle in which data is heavily compressed and only relevant information is preserved.

Keywords:

information bottleneck, sensor networks, cooperative communication, wireless networks, source coding, data compression

Principal Investigator:	Gerald Matz
Institution:	TU Wien
Weitere Projektpartner:innen:	Oswaldo Simeone (New Jersey Institute of Technology (NJIT)) Andy Burg (Ecole Polytechnique Federale de Lausanne (EPFL)) David Gímez-Barquero (Universidad Politécnica de Valencia)

Status: Abgeschlossen (01.01.2013 - 30.06.2017)

GrantID: 10.47379/ICT12054
